## SMART PEOPLE USE SMART PRESSURE RANGE

After the first 18 months of production of the unique Pac 80 and Tools, SULLAIR EUROPE **has now begun production of the Pac 80 E**. At the same time, **they have extended the range of SMART PRESSURE tools to accompany Pac 80 E**. Practical experience, and customer feed back have all been taken into consideration in the new Pac 80E. In addition various design improvements have been included.

**In today's harsh economic environment, any product which can increase utilisation, and reduce costs must be an advantage, especially in the highly competitive Rental Sectors.** Additionally, with the economy of so many countries currently struggling, this new product will provide the ability to carry out some jobs without the expense of traditional compressors and tools.

Smart Pressure and Pac 80E utilise an alternative pressure to the most common 6-7Bar compressors and hand held tools. By utilising this, Sullair have been able to drastically reduce the size of a standard 1 tool compressor, into a power pack sized machine. Engine size has also been reduced from the common 20-30hp diesel engine to a 6.5hp petrol engine. Footprint size has been drastically reduced, so much so that it will now easily fit into a small van or hatchback car. Fuel economy is greatly enhanced, thereby reducing the daily running costs.

**The Smart Pressure range of tools includes a 22kg Paving Breaker, 10kg Demolition Tool, and now a 5kg chipping hammer.** All produce power, and production performance equivalent to the same sized standard pressure tools. In addition, and to help protect the operator, Vibration is significantly reduced.

Storage, when not in use has been enhanced by having the ability to be stacked, again an important issue for Rental Companies. It is, for certain, that the standard pressure range of portable compressors and tools will continue from Sullair. The increased Smart Pressure range of tools with Pac 80E will give all purchasers the opportunity to increase their product offering to their customers based on the actual requirement of the job. By doing this it will enhance the utilisation of all the models in their fleet, this will include standard pressure equipment.
